Product-minded full-stack engineer with 3.5 years shipping consumer experiences at Meta and PayPal (TypeScript, React, GraphQL). Since early 2026: all-in on agentic AI development, building a production AI-orchestration product solo.

EXPERIENCE

Software Engineer

February 2025 – April 2026

Meta — Bellevue, WA

Facebook Monetization: ads-based shopping experiences in the Facebook app

- Led a new ad-format experiment end to end as effectively its sole engineer: built the carousel entry point in Facebook Feed, the full-screen feed of shoppable ads it opens, and the server-side ad-fetching path; owned experiment design, rollout, and analysis, with statistically significant gains of **+116% revenue**, **+172% conversion rate**, and **+98% conversions**; results led leadership to staff a follow-on effort extending the surface to new entry points
- Helped design a client-side ad-loading architecture that queries multiple ad-serving APIs concurrently and merges results on device using a quality-holdout timer that trades marginal ad quality for speed, **cutting the share of sessions stuck loading for 2+ continuous seconds by 65%**
- Built internal tooling the team adopted as standard: a debugging tool reconstructing a unified timeline of every client and server event in a user session, and evaluation tooling for a visual product search MVP **used by 14 technical and non-technical contributors** to judge launch criteria
- Ramped onto native iOS with no prior mobile experience, becoming a lead contributor to the feature's iOS client and authoring the team's guide for migrating Objective-C modules to Swift
- Established the team's first standards for LLM integration in product (prompt versioning, caching, helper APIs) and built an LLM-as-judge pipeline evaluating generated ad search queries; taught teammates to build evals, with utilities adopted across 3 AI projects

Software Engineer II

July 2022 – February 2025

PayPal — San Jose, CA

Identity org: front end of PayPal's consumer login experience

- Owned the front end of consumer login, both the standalone page and a reusable component with a GraphQL layer that other product teams embedded, through its migration to TypeScript/React/Next.js
- Drove a 1% improvement in login success rate, primarily by shipping passkey and passwordless login, resulting in an **\$80 million positive business impact in 2023**
- Cut page load time by **more than 50%** through server-side rendering with Next.js and client-side package reductions
- After a broken E2E test suite let a change disable cookie-based re-login globally for 30 minutes, led a rebuild of Cypress coverage for all login flows; **no comparable incident recurred**

EDUCATION

B.S. Computer Science (Not Completed)

2018 – 2022

Oregon State University, School of Engineering (AI focus)

- Completed 90% of coursework before leaving for a full-time offer; degree not conferred. Coursework: Algorithms, Databases, Machine Learning & Data Mining

SKILLS

Languages: TypeScript/JavaScript, Hack/PHP, Objective-C, Python, SQL, C++

Frameworks & Tools: React, Relay/GraphQL, Next.js, Node.js, ComponentKit (iOS), Cypress, Docker

AI-assisted development (expert): agentic coding workflows (Claude Code), LLM evals & judges, CI guardrails for AI-written code

Distinctions: ICPC 2020 (1st in Oregon) • Google Hash Code 2020 (top 7% internationally)
